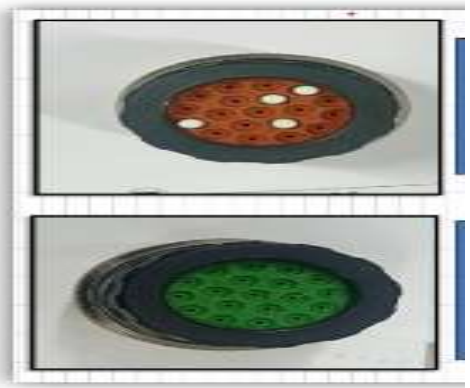
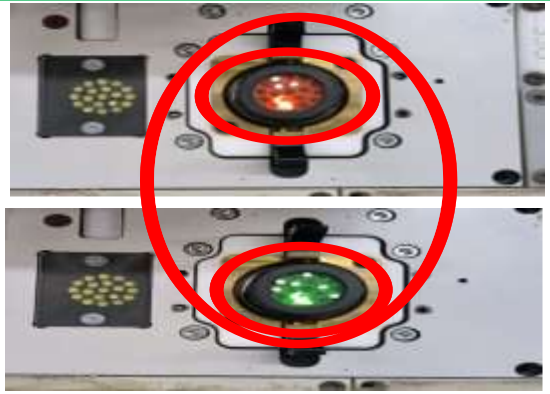
Kaizen Theme: Elimination of wrong connector assembly issue on the limber evlv line.

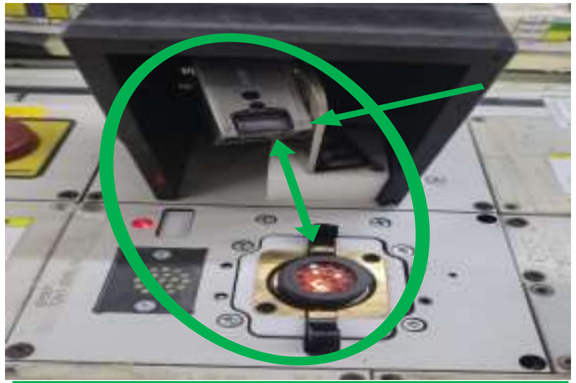
BEFORE

Limber EVLV sub assy-01 **HV BATTERY LV CONNECTOR**have 2 type of connector one in red and secound in green color.





AFTER



Sensor Detected this is not corect connector inserted so wrong connector not paased .

Sensor detected this is ok connector inserted and then it is paasing for the next operartion.

Problem Description:

We have facing the problem of wrong connector attached in the harness on the limber evlv line of and it is ditected on the functional checker becuase no any poka-yoke available for detecting the wrong connector it is totaly depend on operator skill. If operator do this mistake defet will generate and hold the harness for the rework .

Solution Description:

After we have found this problem, we have Installed the Color detection sensor for the error proofing so now Sensor detect the wrong connector (Only in 2 color-green & red connector)and stop the process of wire insertion navigation system.

So now we are prevent the defects produce and save INR 900 connector price for connector rejection.

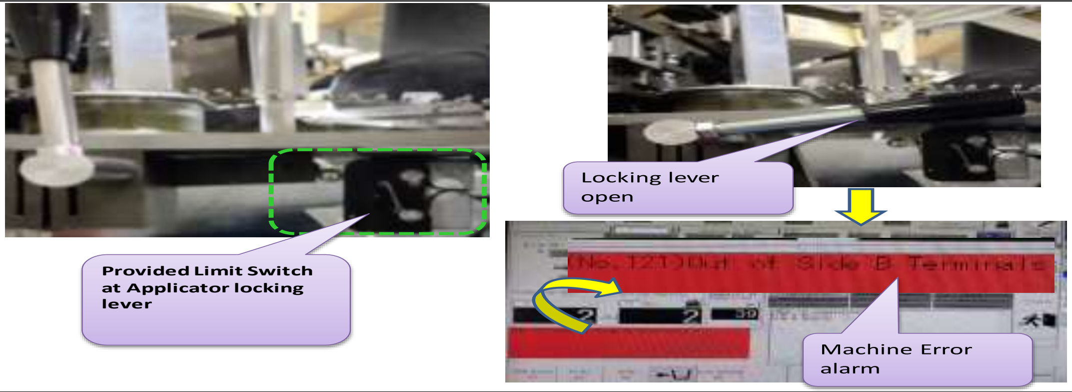
Type of MUDA eliminated	Overproduction ☐	Inventory ☐	Process ☐	Transport ☐	Waiting ☐	Motion ☐	Rework (Defect) ☑
Objective/Target	To avoid applicator unlock error on AC90 machine, Poka-Yoke has been implemented for the applicator lock.						

BEFORE

In AC 90 machine, there is no any provision available to detect Applicator lock open

AFTER



Problem Description:

As you can see in the image, in the earlier situation, there was no any Poka yoke system available in AC 90 machine to avoid applicator unlock due to the design of the machine.

So due to unavailable of Poka yoke for Applicator lock, operator forgets to applicator lock some times & below problem comes after that:

1) Applicator dies gets fully damaged and increased maintenance cost
2) Conductor height (C/H)changed in running
3) Conductor and insullation High- low issue
4) Beark down in form of CFM error
5) Applicator can fully damaged
6) It can create safety issue

This issue happened six times in past three months and total repair cost was 16450 rs.

Solution:

Provided Limit switch at Applicator locking lever and interlocked with out of terminal sensor. Now if the operator does not lock the applicator, Poka Yoke will not allow the machine to run and will give out of terminal alarm.

Result:

After implementing this Poka Yoke technique the machine got completely interlocked and the problem of applicator unlocking was solved. And given issues solved

1) Unnecessory dies damage issues solved
2) Quality defects which was occuring because of Applicator unlock solved like; C/H issue
3) Conductor and insullation High- low issue solved
4) CFM error because of Unlock solved
5) Applicator damaged chance eliminated
6) Safety issue because of Appliocator unlock solved.

After implementation of this Kaizen, Applicator unlocked chance eliminated and we have saved repaire cost which can occured in future.

Investment cost : 680 Rs per machine.

Type of MUDA eliminated	Overproduction ☐	Inventory ☐	Process ☑	Transport ☐	Waiting ☑	Motion ☑	Rework (Defects) ☐

Kaizen Theme: To eleminate MUDA of operator movement for quality Calling

BEFORE

Quality Calling system not available

AFTER

Problem Description:

In before condition there was no facility for quality calling. So in every job setup or any kind of quality support, operator goes to quality area to call the quality inspector. So for calling & attending the quality person to machine we found huge hidden losses like;

Operator time loss
MUDA of operator movement
Machine output loss
Required 5 nos.quality inspector to maintain the line
Loss in operator moral

Solution Description:

As you can see in image we have implemented wire less calling system for quality support calling. Display of this setup we have provided in Quality area and calling switch provided at machine. Now only required of press call switch from switch box for quality support & with help of display and bell sound quality person attending the machine. After implementation of this setup we have got better result;

Operator movement reduced for quality serching
#Operator time saved
Machine output increased
Only 4 nos. qualty inspector maintaining Maikotei area
Machine Operator & quality inspector also feeling happy because their un-necessory movement reduced.
Cost investment for this calling system: 30000 inr.

Kaizen Heading	**To reduce Shield wire scrap by the changing packing standard.**							

BEFORE- 54 Qty

AFTER- 90 Qty

Problem Description:

1. Shield wire comes in 100 m packing in small coil, due to which manpower movement increase for material issue from store.
2. Set up time incraese dure to wire cahnge after 100 m.
3. Shield wire scrap increase due to wire change over after 100 m., No of End piece increase increase scrap.
3. cover more space for storage of single single coil.

Solution Description:

1. By changing packing standard, **Reduce 9 time extra movement of manpower** for matertial from store. **(Excess movement reduced).**
Old Packing Standard -100 M
New Packing Standard- 1000 M
2. Shield cabel unwraping and setup time save.
3. Scrap cost reduce, by improving packing standard & eliminating end piece.
4. Transportation capacity in one trip increased. **(Transportaion cost saved)**
5. Storage capicty in store become double. (Space saving)

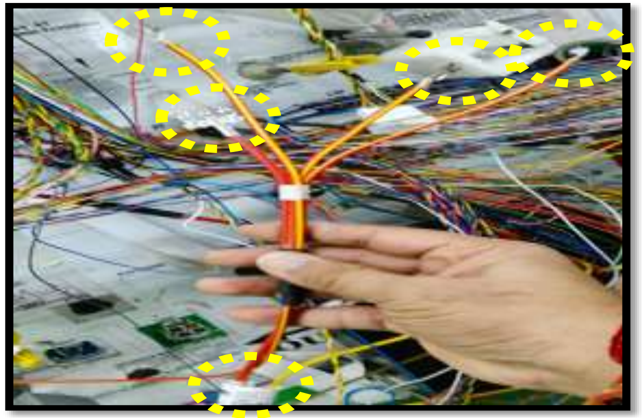
Category	Quality ☑	Cost ☑	Productivity ☑	Delivery ☑	Safety ☑	Environment ☑	5 'S' ☑	
Type of MUDA eliminated	Overproduction ☐	Inventory ☑	Process ☑	Transport ☐	Waiting ☐	Motion ☐	Rework (Defects) ☑	
Kaizen Heading	R/Y joint five insertion given to jig boards due to TPO and terminal damage issues increased in offline process.							

R/Y Joint inseration give to jig boards due to operator not follow the PCPP and 3 lag terminal found damage.



R/Y Joint joint Insertion given to Fusebox at S/ A.

Problem Description:

1. R/Y joint 5 insertion given to jig boards due to TPO and terminal damage issues increased in offline process.

2.during fusebox insertion Operators were taking a lot of time to locate the correct cavity and they wewr inserting the wires into the wrong cavity.

3. 3 leg terminal stuck each other part and getting damage, due to rework increased.
4. During jig board insertion operator confused and insert wire in wrong cavity.

CKT Details :
Line Name : Nova Front.
Sub ASSY: 1D
Comp No : C173,C624 ,C625 ,C531 ,C532, C891
Joint Colour : R/Y.

Solution Description:

1. We have added all joint jig boards fusebox insertion to the sub assmbly with navigation system.due to this the TPO and terminal damage issues have been resolve.

2. The time required for operators to search for the fusebox insertion cavity has been reduced.

3. R/Y Joint wire insertion added in fuse box sub assembly last insertion to avoided entangle during process.

4. Wire color updated fusebox drawing provided on jig board.

5. Navigation program updated and verified.

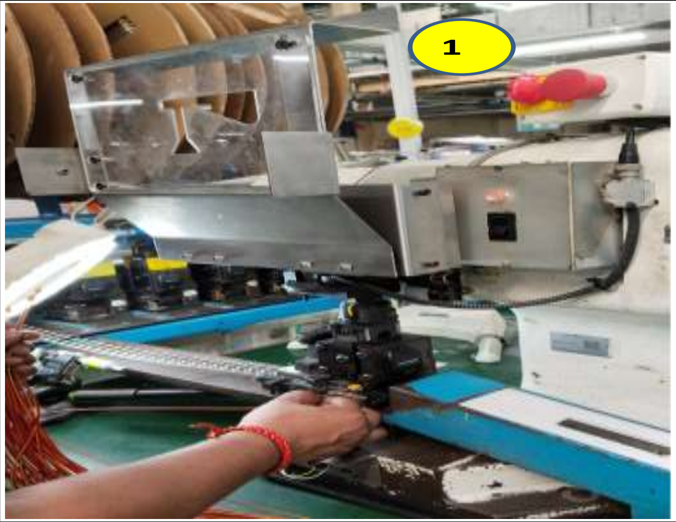
Objective/Target	**To Eleminate Safety issue on Crimping Machine**						

BEFORE



AFTER

Problem Description:	Solution:	Result:
In Before Condition operators are crimping wire without use of protective safety cover. As you can see in picture number 2 and 3, the operator bypassed the safety switch by sticking tape or using a rubber band for the bypass. This is a major safety concern on the crimping machine, and can cause an accident on the machine	As you can see in image 4, we have installed the reverse locking switch on the machine. The machine is now fully interlocked.	# The machine is fully interlocked. # The operator cannot bypass the reverse interlocking. # The machine will not run after ap rubber to the safety switch.
